

Regime A: $a = \delta = 16$ Regime B: $a = \delta = 4$ Regime C: $a = \delta = 2$ Regime D: $a = \delta = 0.64$ Regime E: $a = \delta = 0.25$ 

BLT splitting scheme, exact (dW, inf) noise.
 20000 paths, fine grid 8192 steps.
 Proven L^1 rates: 1 (log) for $a > 2$; $a/2 - \epsilon$ for a in $(1, 2]$;
 $a < 1$ uses the modified scheme (positive part), no theory,
 observed $\min(1, a/2)$. HH-referenced curve shown for
 comparability with the main benchmark convention.
